

Forklift Attachment

Forklift Attachments Huntington Beach - Many different jobs would be impossible without the help of forklift attachments. Forklift attachments make many jobs safer, easier and quicker to complete. In addition to general forklift training, operators must be properly training for each attachment they intent to use. There are many non-hydraulic attachments and hydraulic attachments available for forklift attachments. They provide many benefits including decreasing fuel consumption, time, man-power, damage to stock and employee accidents. Equipment Considerations A forklift attachment can replace an existing forklift attachment or can be added to a forklift that does not already have one. Various considerations need to be taken prior to adding or replacing any forklift attachment. These considerations include the kind of forklift, the machine's capacity, the number of hydraulic functions required to power the attachment's and the type of carriage. Failure to properly consider these factors will increase the safety risk associated with operation of a forklift and its attachments and increase the risk for damage to the forklift, the attachment and surrounding area, including stock. There are further safety issues to take into consideration which can be discussed in more detail below. Forklift Rating and Re-Rating Manufacturers give forklifts a lift capacity rating that needs to be considered and adjusted when adding or changing forklift attachments. Manufacturers of forklift attachments usually offer calculators available online to estimate the safe lifting capacity when using a particular attachment. It is important to note that only the forklift manufacturer can provide accurate lifting capacities. Before installing any kind of attachment, it is essential to contact the local authorized forklift dealer of the particular forklift brand to request that they rate the machine accordingly with the attachment being used. After the manufacturer of the forklift has re-rated the forklift, it should have a new factory authorized specification plate. This new specification plate will replace the original plate and should be installed showing the new rating for the forklift. Equipment Upgrades Forklift attachments rely on the machine's hydraulic function and are made up of a forklift valve that has a lever situated close to the operator. This creates two passages of pressurized hydraulic oil for powering the attachment features. Note that not every attachment is hydraulic; however, the hydraulic attachments provide more features compared to the number of valves the forklift offers. When this happens, the forklift needs to have one or more valves added. There are several methods of adding a valve. The manufacturers of forklifts create accessories to simplify hose and valve routing. However, the parts and labor to install these can be so expensive as to make this option impractical. Alternative methods include adding a solenoid valve in conjunction with a hose or cable reel that diverts oil flow from an existing function. However, the operators' view may be compromised due to the cable reels and hose installation. These parts also may be easily damaged by their location. There are kits available that use a solenoid valve and specialty hoses that allow for the reinforced braid to double as an electrical conduit. These hoses are designed to replace existing ones and stay free from being damaged. The operator can enjoy a clear view with this option. Safety Considerations Proper training must be obtained prior to fitting any forklift attachment. The operator needs to be able to remove, fit and operate the attachment. There are 2 vital safety factors to think about before operating any type of forklift attachment. Firstly, it is important to note that any kind of forklift attachment will reduce the machine's nominal load rating. The nominal load rating is computed with a stock fork carriage and forks. However, the actual load rating may be substantially lower. Using any type of forklift attachment will affect the center of gravity on the machine. This will reduce the forklift's stability. Because the weight of the attachment will be placed in front of the forklift's fulcrum point, it is necessary to drive the forklift as though it is partially loaded, even prior to picking up a load. Thus, when using any attachment, an operator should travel at a slow speed and make turns slowly and gently. As noted above, each attachment should be listed on the data plate of the forklift's capacity. Specific safety checks must be made prior to using each forklift attachment. The attachment must be: 1. Appropriate for the specific forklift being used; 2. Appropriate for the specific load;

3. Attached correctly; 4. Properly locked; and 5. Permitted on the forklift's data plate. List of Common Forklift Attachments Below is a list of popular forklift attachments and their general uses. There are many more attachments available than are listed here but this will cover the most widely-used. As you will see, the large variety of attachments available have the capacity to greatly increase the efficiency of many jobs.

SIDESHIFTER: Allows the operator to move the forks laterally, allowing for easier placement of a load without the need to reposition the entire forklift. **FORK POSITIONERS:** Moves the forks together or apart in relation to one another to adjust for various load types. **DIMENSIONING DEVICES:** Dimensioning devices feature cargo dimensions useful for creating better efficiency in trucks, trailers and warehouses. This technology is often used alongside billing systems that monitor volume. **ROTATOR:** Assists in righting skids that have tilted, handling custom load requirements and quick unloading. There is a rotator feature on numerous attachments. **ROLL AND BARREL CLAMP:** The roll and barrel clamp simplifies grasping rounded loads such as barrels. It has numerous pressure settings for handling fragile items with less damage potential. This attachment often has a rotate function to change the load from a vertical to a horizontal position. **CARTON AND MULTIPURPOSE CLAMP:** The carton and multipurpose clamp has pressure settings and is used for handling more squared shaped loads. It easily masters boxes, bales and cartons. **POLE ATTACHMENTS:** Long, metal pole used in place of forks to lift rolled items such as carpet or linoleum. **SLIP SHEETER OR PUSH-PULL:** Allows operator to transport slip sheets by clamping onto slip sheets, as opposed to pallets, and either pulling the slip sheet onto wide and thin metal forks for loading or pushing the slip sheet to unload. Some variations of the attachment are Save, where the slip sheet is removed for reuse, or Standard. **DRUM HANDLER:** Allows for grasping drums, either with a spring-loaded jaw to grip the top lip of a drum, or with arms that encircle the drum, for transport. **DRUM AND STORAGE BIN TIPPER:** The drum and storage bin tipper is designed for easier transport of liquid items or loose materials into bigger containers. **MAN BASKET:** The lift platform known as a man basket is designed to transport workers vertically. It is outfitted with brackets and railings to anchor safety harnesses. **TELESCOPIC FORKS:** The telescopic forks are used in locations with a two pallet stacking design where one shelf is placed right behind another with no aisle between them. **SCALES:** Scales are helpful for allowing operators to transport pallets while weighing them. This stops the need for interrupting work with regular travel to the scales. It can be used in legal-for-trade weights for operations that bill by how much items weigh. **SINGLE-DOUBLE FORKS:** The single-double forks can be used alongside regular lifting tasks. It allows a single pallet or platform to move or two pallets beside each other. Additional attachments can be used and this replaces the need for having a separate specialty unit; thus reducing maintenance and operating costs associated with more than one machine. **SNOW PLOW:** Snow plows are used to remove snow and redistribute it; however, this attachment can be used with other loose kinds of material. **SKIPS:** Allows safe and speedy removal of waste to the appropriate skip or waste compactor. Skips are available in a roll-forward type and a bottom-emptying type. **BOOMS AND JIBS:** Allow for extended reach of a forklift to transport suspended loads or loads that are stacked high or deep. They are available in different setups such as reach over and precision lifting or low profile fixed and extendable lengths.
